### **LLM Data Collection**

We collected a total of 35023 valid LLM responses across 20 surveys.

#### $\mathbf{Cost}$

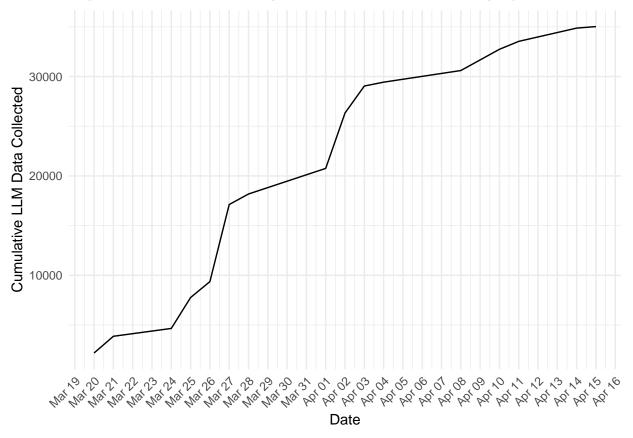

We spent a total of 411.3 USD. The cost breakdown per API is below.

Table 3: Costs by API

api	$num\_models$	credits_paid
OpenAI API	9	225.52
Anthropic API	6	75.00
xAI API	4	29.95
Cohere API	5	20.34
Mistral AI API	8	20.00
Alibaba Cloud	8	17.49
Together AI	8	13.00
DeepSeek API	2	10.00
Google Could	5	NA
ollama	9	NA

#### Time

It took a total of 170 hours<sup>1</sup> across 26 days to complete data collection. Most of it was done in parallel. The first LLM response was collected on Thursday, Mar 20, 2025 and latest on Tuesday, Apr 15, 2025.

#### **Excluded Models**

16 out of 67 were excluded from the analysis for the following reasons.

Table 4: Excluded models and reasons

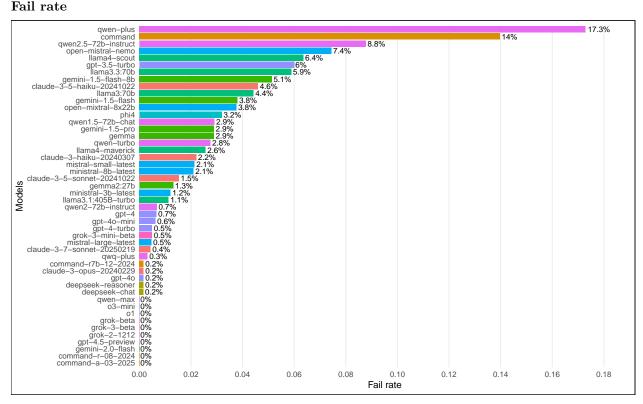

Provider	Model	Reason for exclusion
anthropic	claude-3-sonnet- 20240229	not available in Anthropic API anymore
cohere	command-r-plus-08- 2024	uniform aggregated considerations (1s)
deepseek	deepseek-v2	high fail rate (85%)
deepseek	deepseek-v2.5	too big to run locally; not available through APIs
google	gemma3:12b	uniform aggregated considerations (1s)
meta	llama2:13b	does not respond to prompts correctly
meta	llama2:70b	does not respond to prompts correctly
meta	llama3.2	3% success rate on auscj
microsoft	phi	does not respond to prompts correctly
microsoft	phi2	same model as phi
microsoft	phi3	does not respond to prompts correctly
microsoft	phi3.5	10% success rate for biobanking_wa

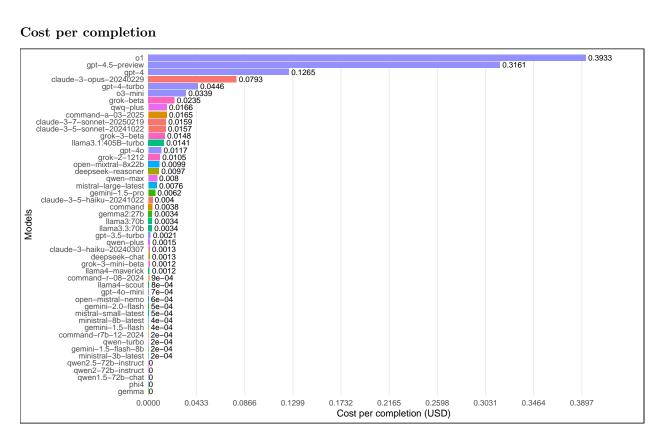

<sup>&</sup>lt;sup>1</sup>Execution data is mostly accurate. Only a few (3-5) executions failed and, as a result, we have no record of it.

Provider	Model	Reason for exclusion
	open-mistral-7b open-mixtral-8x7b	11% success rate for auscj, uppsala_speaks, and biobanking_wa 6% success rate on fremantle only
	o1-mini	0% success rate on uppsala_speaks only; responds with "I'm sorry, but I can't help with that."
qwen	${\it qwen 1.5-110b-chat}$	has API limit of 10 RPM; too slow

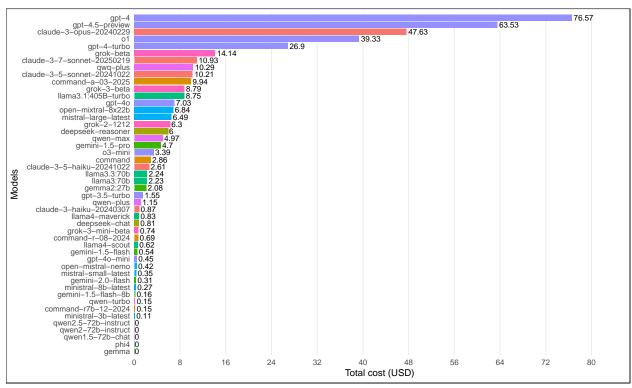

### **Execution Summary Plots**

#### Fail rate

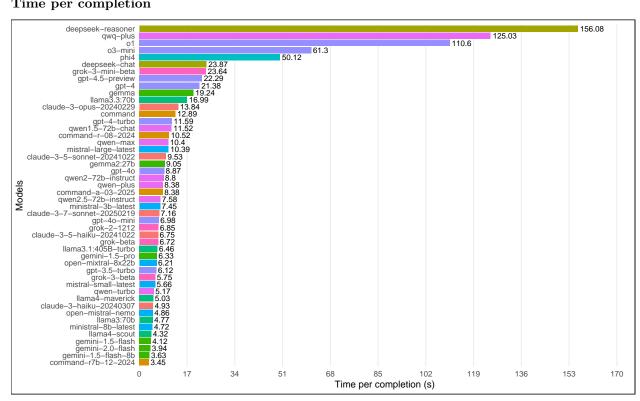

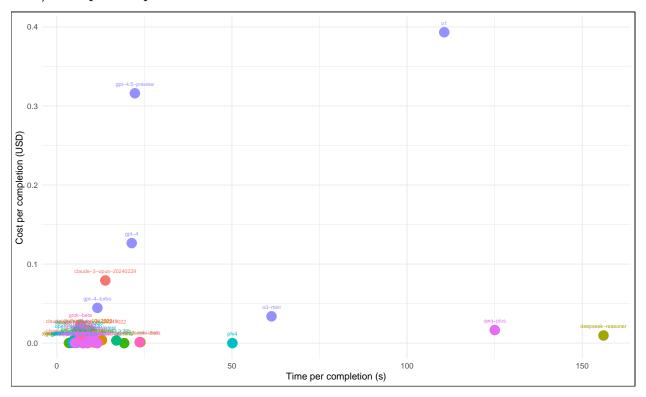

#### Total cost

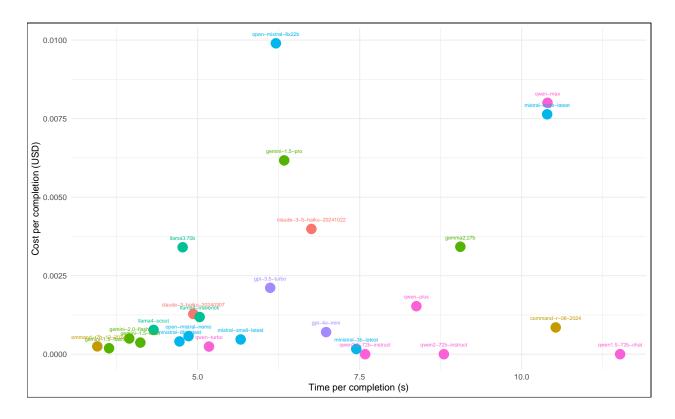

#### Time per completion

#### Cost/Time per completion

Zoomed in to cost < 0.01 USD and time < 12 s.

### Internal Consistency of Responses

We calculate Cronbach's Alpha from the top 30 iterations.

#### Check alpha results per model

Table 5: Alpha summary across models, mean across surveys

	provider	model	N	all	considerations	policies

47	openai	01	100	0.92	0.92	0.77
48	openai	o3-mini	100	0.92	0.91	0.80

### Aggregation

We then aggregated LLM data into 1 response per model/survey. Based on (Motoki, Pinho Neto, and Rodrigues 2024), we bootstrap considerations 1000 times.

#### Aggregate considerations and preferences

We aggregated 30401 LLM responses into 960 responses: 1 response per model per survey.

### **Human Data**

Table 6: Number of participants in each case study

	Case	Survey	Participants
1	Citizen Parliamentarian	acp	45
2	HGE Control Group	auscj	19
3	HGE Deliberative Group	auscj	23
4	BEP	bep	16
5	Mayo	biobanking_mayo_ubc	17
6	UBC Bio	biobanking_mayo_ubc	17
7	WA Citizens	biobanking_wa	9

	Case	Survey	Participants
8	WA Stakeholder	biobanking_wa	15
9	CCPS ACT Deliberative	ccps	31
10	Aargau	ds_aargau	16
11	Bellinzona	ds_bellinzona	8
12	CSIRO NSW	energy_futures	12
13	CSIRO WA	energy_futures	17
14	FNQCJ	fnqcj	11
15	Forest Lay Citizen	forestera	9
16	Forest Stakeholder	forestera	11
17	Fremantle	fremantle	41
18	GBR	gbr	7
19	Activate	uppsala_speaks	26
20	Standard	uppsala_speaks	22
21	UPSA Control Group	uppsala_speaks	20
22	Valsamoggia	valsamoggia	16
23	Thalwill	zh_thalwil	14
24	USTER	zh_uster	15
25	Winterthur	zh_winterthur	16
26	Zukunft	zukunft	63

We collected 1032 human responses across 26 case studies, including pre-post deliberation responses.

### Randomly Generated Data

Then, we generated 20 random reseponses, one for each survey.

### **DRI** Analysis

We begin by defining DRI calculation functions.

```
# original DRI formula
dri_calc <- function(data, v1, v2) {</pre>
  lambda <- 1 - (sqrt(2) / 2)
  dri <- 2 * (((1 - mean(abs((data[[v1]] - data[[v2]]) / sqrt(2)</pre>
  ))) - (lambda)) / (1 - (lambda))) - 1
  return(dri)
# updated DRI formula
# FIXME: only accounts for negligible positive correlations, but not negative ones
dri_calc_v2 <- function(data, v1, v2) {</pre>
  # Calculate orthogonal distance for each pair
  d <- abs((data[[v1]] - data[[v2]]) / sqrt(2))</pre>
  # Define lambda as in the original
  lambda <- 1 - (sqrt(2) / 2)
  # Calculate penalty: 0.5 if both correlations are in [0, 0.2], 1 otherwise
  penalty <- ifelse(data[[v1]] >= 0 & data[[v1]] <= 0.2 & #0.3</pre>
                       data[[v2]] >= 0 & data[[v2]] <= 0.2, # 0.3
```

```
0, 1)
  # Adjusted consistency per pair
  consistency <- (1 - d) * penalty</pre>
  # Average consistency across all pairs
  avg_consistency <- mean(consistency)</pre>
  # Scale to [-1, 1] as in the original
  dri <- 2 * ((avg_consistency - lambda) / (1 - lambda)) - 1
  return(dri)
}
# updated DRI formula: penalizes both negligible
# positive and negative correlations in a scalar way.
dri_calc_v3 <- function(data, v1, v2) {</pre>
  d <- abs((data[[v1]] - data[[v2]]) / sqrt(2))</pre>
  lambda \leftarrow 1 - (sqrt(2) / 2)
  # Scalar penalty based on strength of signal (|r| and |q|)
  penalty <- ifelse(pmax(abs(data[[v1]]), abs(data[[v2]])) <= 0.2, pmax(abs(data[[v1]]), abs(data[[v2]])</pre>
  consistency <- (1 - d) * penalty</pre>
  avg consistency <- mean(consistency)</pre>
  dri <- 2 * ((avg_consistency - lambda) / (1 - lambda)) - 1
  return(dri)
```

## Warning: Missing swiss\_health from DRIInd.LLMs!

### Hypotheses Testing

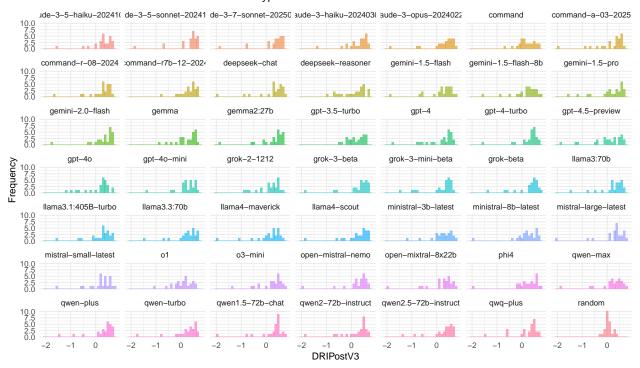

# H1. DRI scores of LLMs do not significantly differ from those produced by a random generation process.

#### Testing assumptions

We employed a one-way ANOVA (or a Kruskal-Wallis test, depending on the results of the exploratory analysis) between subjects to analyze our results. If normality and homogeneity of variance assumptions are met, we will use ANOVA followed by Tukey's HSD post-hoc test for pairwise comparisons between LLM/version DRI and random DRI. If assumptions are violated, we will use the non-parametric Kruskal-Wallis test, followed by Dunn's post-hoc test with Bonferroni correction.

The independent variable is be the type of participant (e.g., random, model). The dependent variable is the individual-level DRI score.

#### Distribution of DRIPostV3 for Each Source Type

#### Testing hypothesis

```
##
## Kruskal-Wallis rank sum test
##
## data: DRIPostV3 by source
## Kruskal-Wallis chi-squared = 71.571, df = 48, p-value = 0.0153
```

#### Post-hoc tests

##
## alpha = 0.05
## Reject Ho if p <= alpha/2</pre>

Some models, 10 out of 48, are significantly different than random.

## DRI Benchmark

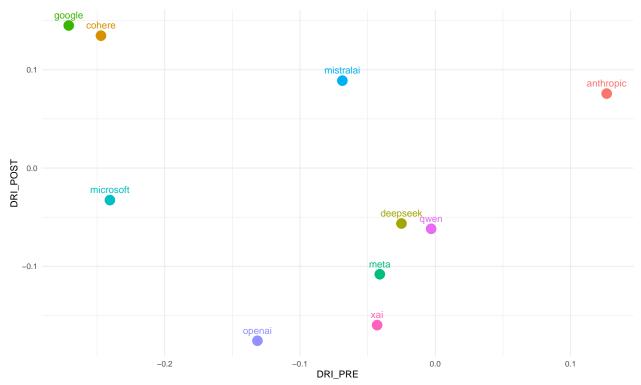

##  $geom_smooth()$  using formula = 'y ~ x'

### Correlation between Context Length and Mean Alpha All

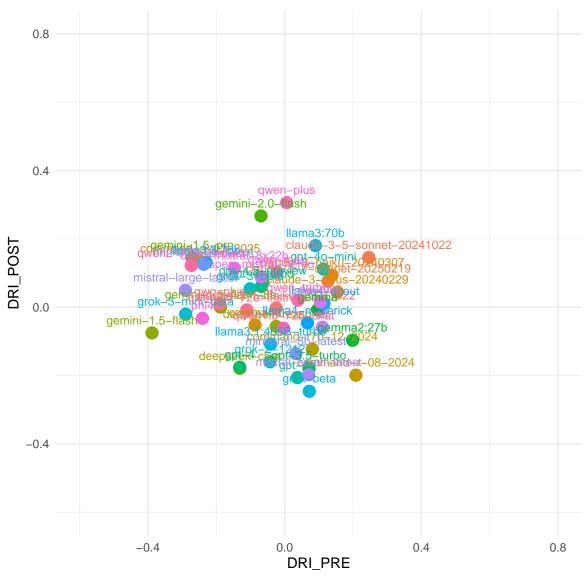

## `summarise()` has grouped output by 'provider', 'model'. You can override using
## the `.groups` argument.

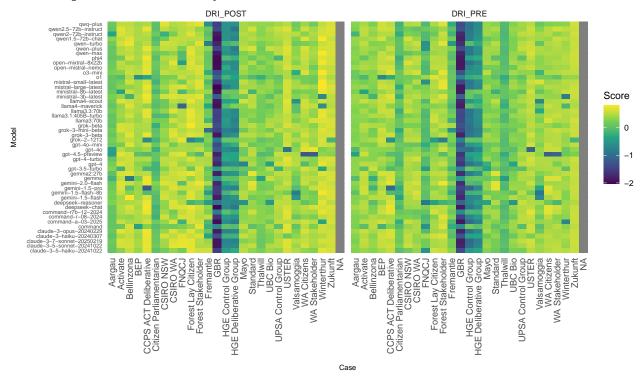

### Comparison PRE and POST DRI by Provider

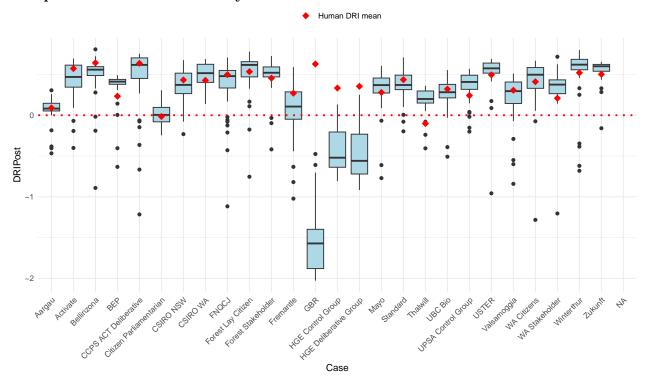

### Comparison PRE and POST DRI by Model

PRE vs. POST Aggregate Scores Correlation Across LLMs

#### **Human-Normalized Performance**

Red dotted line = Human benchmark (Normalized Score for each indicators = 1)

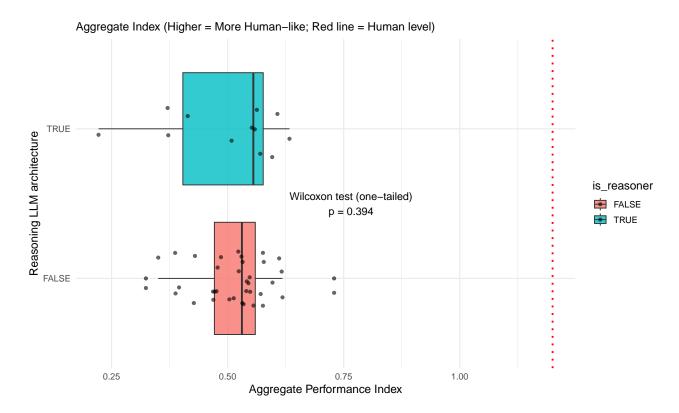

#### LLM Performance by Reasoner Classification

Architecture types:

• Transformer-based models (Vaswani et al. 2017).

Some models are considered "reasoning" models, like , reason using chain-of-thought (CoT) – this is not a difference in architecture, but in how
